# EC-Net 4 Alarm Console

Overview

The EC-Net 4 Alarm Console is a flexible client application for monitoring alarms from EC-BOS or Supervisor nodes and provides a low cost way for users that do not require the full EC-Net 4 Pro to monitor, acknowledge and review current alarms within a building or campus. This is a "thickclient" application designed to be loaded on the user's PC for remote alarm monitoring of one or more EC-BOS or a Supervisor.

Multiple copies can be purchased to allow users with different responsibilities to monitor only the things for which they are responsible. A security office can have a copy to monitor only security alarms and a HVAC technician can have a copy to monitor critical building systems, each with his/her own console.

Applications

☐ Sophisticated alarm processing and routing, including e-mail and paging.

☐ Supports multiple EC-BOS or Supervisor stations connected to a local Ethernet network, or the Internet via the standard notification class connection(s).

Features & Benefits

☐ Thick-client application for installation on a user's PC.

☐ Provides standalone Alarm Monitor capability for those users not requiring a full system engineering tool.

☐ Alarm view allows user to view current alarms as well as those previously acknowledged.

☐ Hyperlinks (if used) in alarms may be used to "go to" the Web page where the alarm point is displayed graphically to view more information.

☐ Password protection and security using standard Java authentication and encryption techniques.
